

Responsive Design Exercise

Create an HTML page with CSS to match the following website design. Your design should be responsive and change to the layout shown in the second figure when the screen is less than 600px.

Important: when less than 600px columns 1 and 3 are at the top, column 2 goes down below!

Implement the design using flexbox for the columns and menu, then using grid for the entire layout.

If time allows create another version using a CSS framework.

Bootstrap has long been the biggest CSS Framework and therefore what most people use when doing this part of the assignment. Because Tailwind has gained a lot of popularity lately and as such I'm happy for you use it instead.
